How Do Websites Actually Work?

What are HTML, CSS, JS?

HTML is the structure of your site. It adds whatever you want to the site. CSS make them look the exact way you want. Although it won't add anything to your site. JS makes your site to actually do something. For example when you write a word in google search bar, it shows you the relevant searchs. Or for example, when you click a bottom, it sends email. These are achieved through JS. When we request a site from our browsers, the files that we recieve is HTML, CSS and JS of that site.
