CSS Static and Relative Positioning

September 24, 2020

TIP

1.content is everything
order comes from code
children sit on top of parents

Position

static/relative/absolute/fixed

static

all html elements are static by default. keep to the code flow

relative

positions the element relative to it's static position.
top/bottom/left/right

TIP

in relative positioning, its like the element still has its own space. and when it moves around, it doesnt push other objects away. it comes on top of them. but still it has its own space in its relative place

TIP

relative positioning doesnt do anything by itself. its only usable when its used with one of the directions said above
